**Abstract:**

Source: CH669685A The security access system uses an ante-chamber (1), with opposing entry and exit doors (4,5), between the outside (A) and the security zone (B), for allowing a security check of each individual attempting access to the latter. A detector within the ante-chamber provides a security check for potentially dangerous objects or materials, e.g. arms or explosives, with a security room (2) communicating with the ante-chamber (1) to allow the individual to be detained, without impaling access to the security zone (B) for subsequent individuals.
